

IN THE CLAIMS

Please amend the claims as shown below.

27. (Original): An electronic circuit having
an input for inputting at least one information signal;
an energy means for converting energy contained in the at least one
information signal into a voltage supply;
a control means for generating at least one switch-on control signal when
an information signal arrives; and
a signal processing means for storing an information item represented by
the at least one information signal and/or for evaluating an information item
represented by the at least one information signal and storing the secondary
information obtained through the evaluation by means of at least one ferroelectric
flip-flop;
wherein the signal processing means can be activated by the at least one
switch-on control signal for the purpose of evaluation and/or storage;
and wherein, during the evaluation and/or storage, the at least one
information signal may be the sole energy source for the electronic circuit;
wherein the at least one switch-on control signal has the following signals;
an activation signal for activating precharge transistors of the at least one
ferroelectric flip-flop;
transfer signal for transferring the information contained in ferroelectric
capacitors of the at least one ferroelectric flip-flop onto internal data lines of the at
least one ferroelectric flip-flop; and
a current switching signal for switching on the voltage supply of the signal
processing means.
28. (Currently amended): The electronic circuit as claimed in claim [1] 27,
wherein the control means can generate at least one switch-off control signal after a
predetermined time has elapsed after the at least one information signal arise and when
the energy converted from the at least one information signal is exhausted,
wherein the signal processing means can be caused or is caused to effect
a storage and to effect deactivation by the at least one switch-off control signal.

29. (Currently amended): The electronic circuit as claimed in claim ~~1 or 2~~ 27 or 28, wherein the information stored in the at least one ferroelectric flip-flop can be converted into at least one output signal by the signal processing means and the electronic circuit furthermore has at least one output for outputting the at least one output signal.

30. (Currently amended): The electronic circuit as claimed in claim [1] 27, wherein the electronic circuit furthermore has a display means for displaying the information stored in the at least one ferroelectric flip-flop.

31. (Currently amended): The electronic circuit as claimed in claim [4] 30, wherein the display means is concomitantly supplied by the voltage supply generated by the energy means.

32. (Currently amended): The electronic circuit as claimed in claim ~~4 or 5~~ 30 or 31, wherein the display means has an LCD display.

33. (Currently amended): The electronic circuit as claimed in claim [3] 29, wherein an external voltage supply and external control means can be connected for the outputting of the information stored in the at least one ferroelectric flip-flop by the signal processing means.

34. (Currently amended): The electronic circuit as claimed in claim [2] 28, wherein the at least one switch-off control signal has the following signals:

- a transfer end signal;
- an activation signal for activating precharge transistors of at least one ferroelectric flip-flop; and
- a current switch-off signal for switching off the voltage supply of the signal processing means.

35. (Currently amended): The electronic circuit as claimed in claim [1] 27, wherein signal lines for each of the switch-on signals lead from the control means to the signal processing means.

36. (Currently amended): The electronic circuit as claimed in claim ~~8 or 9~~ 34 or 35, wherein signal lines for each of the switch-off signals lead from the control means to the signal processing means.

37. (Currently amended): The electronic circuit as claimed in claim [10] 36, wherein, for the transfer signal and the transfer end signal, a common transfer signal line leads from the control means to the signal processing means, the transfer signal consists in the application of a voltage to the common transfer signal line and the transfer end signal consists in the disconnection of the voltage on the common transfer signal line.

38. (Currently amended): The electronic circuit as claimed in claim [10] 36, wherein, for the current switching signal and the current switch-off signal, a common current signal line leads from the control means to the signal processing means, the current switching signal consists in the application of a voltage to the common current signal line and the current switch-off signal consists in the disconnection of the voltage on the common current signal line.

39. (Currently amended): The electronic circuit as claimed in claim [1] 27, wherein the signal processing circuit is a counting circuit for evaluating a plurality of information signals, which arrive successively or simultaneously by counting the information signals that have arrived.

40. (Currently amended): The electronic circuit as claimed in claim [13] 39, wherein the counting circuit comprises a plurality of cascaded edge-controlled ferroelectric flip-flops, in which the at least one information signal is input into the clock input of the first ferroelectric flip-flop of the plurality of cascaded ferroelectric flip-flops and the output of each of the ferroelectric flip-flops, except for the last, is in each case also connected to the clock input of the ferroelectric flip-flop connected downstream.

41. (Original): A method for storing information represented by at least one information signal or information obtained through evaluation of the at least one information signal in at least one ferroelectric flip-flop in a signal processing means, having the following steps:

- A: generating at least one switch-on control signal from an information signal that has arrived, and generating a voltage supply from energy contained in the at least one information signal;
- B: activating the signal processing means by the switch-on control signal and applying the voltage supply to the signal processing means, wherein step B has the sub-steps:
 - B1: activating precharge transistors of the at least one ferroelectric flip-flop by applying a voltage;
 - B2: deactivating the precharge transistors of the at least one ferroelectric flip-flop by disconnecting the voltage;
 - B3: applying a voltage to ferroelectric capacitors of the at least one ferroelectric flip-flop for transferring the information stored in the ferroelectric capacitors to logic gate of the at least one ferroelectric flip-flop; and
 - B4: activating the voltage supply of the logic gates of the at least one ferroelectric flip-flop;
- C: storing an information item represented by the at least one information signal and/or evaluating an information item represented by the at least one information signal and storing the secondary information obtained through the evaluation by means of at least one ferroelectric flip-flop;
- D: generating a switch-off control signal after a predetermined time has elapsed after the at least one information signal arrives and/or when the energy converted from the at least one information signal is exhausted; and
- E: deactivating the signal processing means by the switch-off control signal.

42. (Currently amended): The method as claimed in claim [15] 41, wherein step E has the sub-steps:

- E1: disconnecting a voltage present across ferroelectric capacitors of the at least one ferroelectric flip-flop;
- E2: deactivating the voltage supply of the logic gates of the at least one ferroelectric flip-flop;
- E3: activating precharge transistors of the at least one ferroelectric flip-flop by applying a voltage; and
- E4: deactivating the precharge transistors of the at least one ferroelectric flip-flop by disconnecting the voltage.

43. (Currently amended): The method as claimed in one of claims ~~15 or 16~~ 41 or 42, wherein the electronic circuit contains a plurality of ferroelectric flip-flops and the evaluation comprises a summation of the value represented by the information signal and a value already stored in the ferroelectric flip-flops.

44. (Currently amended): The method as claimed in claim [17] 43, wherein the summation is effected by means of a counting operation, in which plurality of ferroelectric flip-flops are cascaded in a counter arrangement and an arriving information signal increments or decrements a counter reading of the counter arrangement by the value 1.

45. (Currently amended): The method as claimed in claim [15] 41, wherein the information stored in the at least one ferroelectric flip-flop can be converted into at least one output signal and be output from the electronic circuit.
